

Installation and Setup guide

One Page Checkout module for Prestashop™ 1.5 - 1.6

December 02, 2015

Overview

This guide describes basic installation and setup instructions for One page checkout (OPC) module for Prestashop.

Main goals the OPC module addresses are:

- True One page checkout, with payment methods visible right on page load
- Compact and uniform styles to provide professional checkout form look
- Handful of small options to control and fine-tune checkout process, including Review summary box to comply with German eshop law, etc.

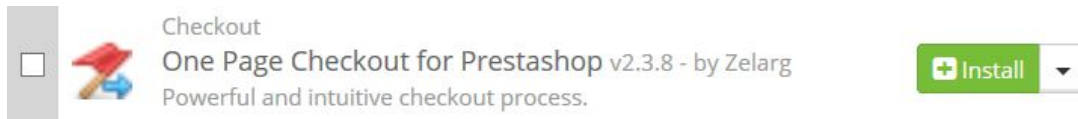

Installation

There are 2 possible ways to upload (any) module to Prestashop. One being using Prestashop Backoffice only, the other one using FTP to copy installation files over to your hosting structure.

1. Copy module to Prestashop:

- a. **Using Prestashop Backoffice:** Log-in to your Backoffice and go to Modules and services. There at the top right corner use Add new module button. Locate the downloaded file (with .zip extention) and upload it. Depending on your log-in status in Backoffice, there might appear a warning about installing third-party modules, please confirm that. Now module is ready to be installed.
- b. **Using FTP:** You either have already FTP details - used to copy Prestashop installation files to your hosting provider, or you have cPanel access, so you can create FTP account on your own (please refer to cPanel manual, generally there shall be a link FTP accounts / Create new, there specify login, password and path to your web folder - often /public_html/). Next, on your local computer, unzip downloaded module package - that would result in onepagecheckout folder, which you copy (as a folder) to modules/ directory on your FTP. Now module is ready to be installed.

2. **Install:** Navigate now to Backoffice, menu item Modules and services and in Modules List search box, type in onepagecheckout. That shall locate OPC module with install button on the right side:

Click the Install button, and if everything is working as it should, you shall see confirmation message, with OPC module configuration page:

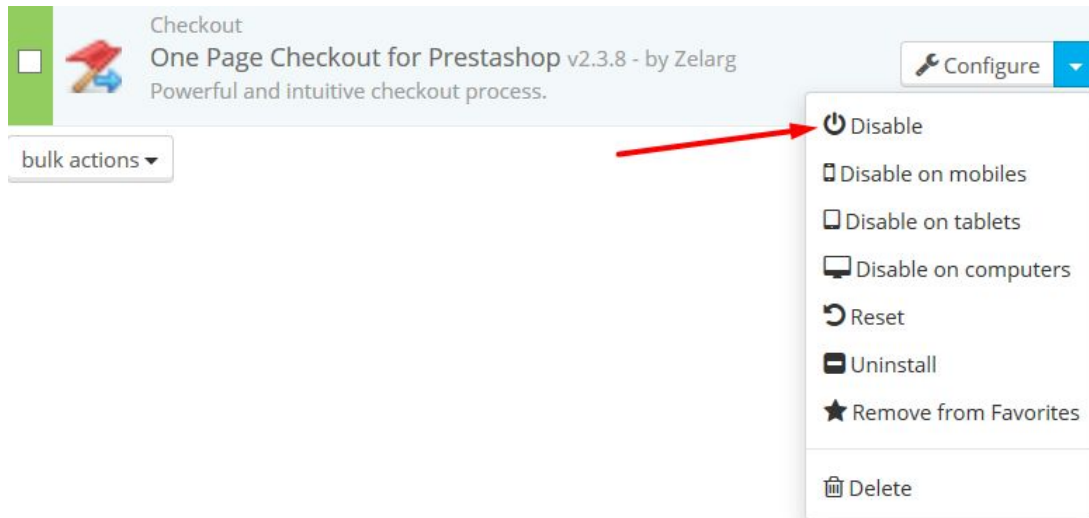

Disabling module

Should the module misbehave, or any error messages would start appearing on checkout page, please go again to Backoffice, menu item Modules and services and in Modules List

3

locate onepagecheckout and choose Disable from dropdown box at the right side:

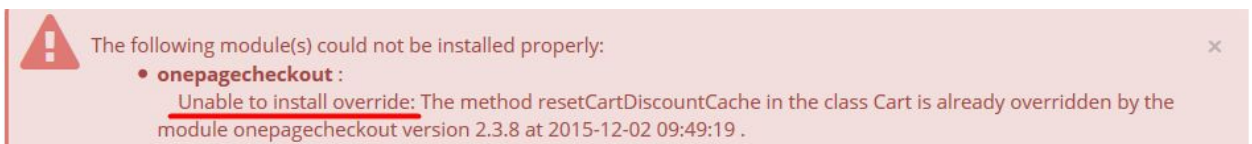

Please do not Uninstall module at this stage, if Disabling doesn't help, there's a chance Uninstalling would make it even worse.

In any case, if there are slightest issues with module please contact support team using 'Contact developer' link on Addons market. We're quite responsive and happy to help you and in no case we'll let you you down with troubles.

Basic troubleshooting

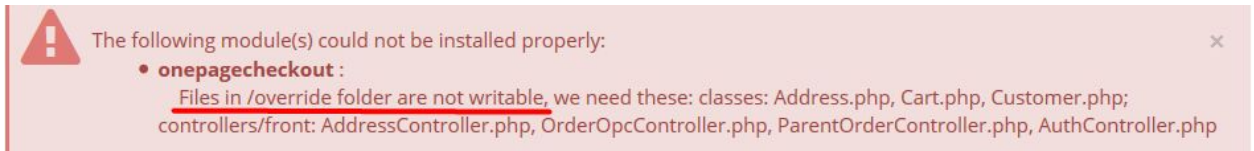

Here's a list of frequent issues that might occur and suggestions to resolve them.

❖ Installation fails with error 'Unable to install override':

Reason is that some of your overrides were already changed, either by another third party module or with incorrect uninstallation of OPC module from the past. This needs to be reviewed carefully, so our suggestion is - please contact support team using 'Contact developer' link on Addons market.

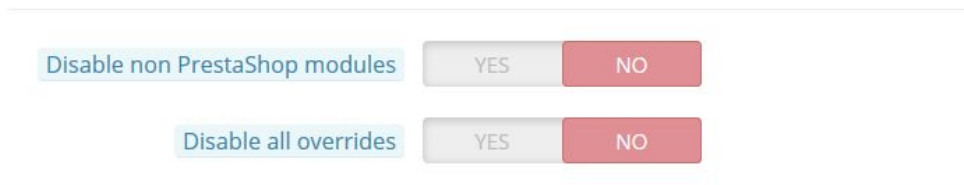

❖ Installation fails with error 'Files in /override folder are not writable':

Here the simple reason is that Prestashop installer doesn't have write access to /override folder and thus is unable to install overrides properly. You can fix this by yourself if you know how to change files permissions (/override folder needs write flag for webserver user); or simply contact our support team using 'Contact developer' link on Addons market.

❖ OPC module is installed, but doesn't appear on frontend

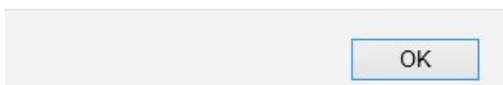

Often times the issue is due to disabled overrides in Prestashop config. Please navigate to Backoffice, menu item Advanced Parameters / Performance and there in Debug mode section check if both options are set to NO, like this:

❖ On checkout page there's error: 'TECHNICAL ERROR - unable to save address':

TECHNICAL ERROR: unable to save adresses

Details:
Error thrown: [object Object]
Text status: error

There are 2 common reasons why this issue occurs, here's the checklist you may try:

1. Navigate to Backoffice, menu item Customers / Addresses, scroll down and expand a button 'Set required fields for this selection'. Make sure that all

checkboxes in result list are unticked, like this:

* REQUIRED FIELDS

Select the fields you would like to be required for this section.

<input type="checkbox"/>	Field Name
<input type="checkbox"/>	company
<input type="checkbox"/>	address2
<input type="checkbox"/>	postcode
<input type="checkbox"/>	other
<input type="checkbox"/>	phone
<input type="checkbox"/>	phone_mobile
<input type="checkbox"/>	vat_number
<input type="checkbox"/>	dni

2. Second common reason started to appear with PS 1.6.1.2 release, where free shipping property type in PS core has been changed from number to boolean. This has not yet been reflected in all third party templates, so in case you've got a bit older template without this change implemented, please edit file `themes/YOURTHEME/js/cart-summary.js` and comment out few lines as suggested in this fix from Prestashop:

<https://github.com/PrestaShop/PrestaShop/commit/ed48e0f6074bb26ab20b4a1020175127da2235d1>

If you're not sure how to go about this change, feel free to contact our support team using 'Contact developer' link on Addons market.

❖ My payment module is not listed in OPC payment selection.

OPC module does it best at parsing and guessing payment methods structure, but that evolves in time with payment modules updates and new ones appearing, so sometimes this needs a bit of treatment. Just contact our support team using 'Contact developer' link on Addons market and any payment method integration shall be resolved in timely manner.

Support

Do not feel comfortable installing module yourself? Or do you face any kind of issue not listed above? Our support is happy to help (free of charge), just contact us using 'Contact developer' link on Addons market.
